

## DIRECTIONS FOR INDOOR, YARD AND AGRICULTURAL USE

**FLOWERS AND VEGETABLE GARDENS** -- For garden vegetables of finest quality and flowers of outstanding beauty, one pound of **EXCELERITE** to each 40 square feet of soil will prove most effective. Work the **EXCELERITE** into the topsoil and water sufficiently to fully dampen the soil.

**HOUSE PLANTS** -- Add between one full teaspoon to two full tablespoons of **EXCELERITE** depending on pot and plant size; mix carefully with potting soil. Apply water the same day in normal amount.

**LAWNS** -- One pound of **EXCELERITE** to each 40 square feet of lawn. For pre-seeding of lawns; apply to top soil and rake in well over the entire surface. Old lawns--apply **EXCELERITE** evenly to the lawn and sprinkle gently with water immediately after the application to prevent wind dispersion.

**SHRUBS, HEDGES and BUSHES** -- Apply one to two cups of **EXCELERITE**, based on size, sprinkled around the base of each plant. Mix into the soil thoroughly and then gently water to soak it into the soil.

**TREES** -- First time application of 50 pounds of **EXCELERITE** for each large or older tree is recommended. 20 pounds is usually sufficient for young trees. Apply in a circle pattern around the base of the tree and thoroughly mix with the soil for best results. Water as usual. For subsequent applications reduce quantity by 50% for the next two years, then apply this reduced amount only every other year thereafter.

**LARGE ACREAGE / FARMS** -- 500 lbs. per acre applied with either a dust shroud or drop spreader. **EXCELERITE** may also be liquefied prior to application. If using traditional or chemical fertilizers mix in **EXCELERITE** with equal weight amounts of other fertilizers. Over time you can reduce the use of chemical fertilizers in the mix.

**EXCELERITE** is an all natural product mined in Lincoln County, Nevada. The Panaca Meadow Lake Basin Deposits have been known for years as a valuable soil conditioner, rejuvenator and fertilizer booster. Documented testimonials spanning seven decades attest to the efficacy of adding Excelerite, with its nutrients and chelated minerals in trace amounts, as a primary application or in concert with a conscientious fertilization and watering program. With many plant families results can be measured within just 2-3 weeks. Re-mineralize and rejuvenate your soil and tell us about your success with everything from house plants, outdoor flowers, vegetable gardens, fruit trees, lawns, golf courses and even commercial farming.

For more information or to post results please go to: [www.usnm.com](http://www.usnm.com)

Excelerite is mined from a natural lakebed deposit consisting of ultra fine colloidal particles, nutrients, chelated trace elements and organic matter. Follow instructions and do not over apply. If a little bit is good, a lot more is not necessarily better.
